

Ziptrrip Tech questions

Challenge: Make a todo application

Frontend:

Implement a basic react application. Application has to be multiple page instead of SPA.

Make one page for todos list. Add the necessary features here. (refer to online todo applications for feature ideas)

Make second page for single todo item. This page should receive a query parameter of todo id and display the todo (plus any other information that you associate it with).

Backend:

Implement a nodejs app with expressjs.

Create CRUD apis for todos.

Save the data in a file or in a database. Either is fine.

To qualify:

1. Checkin the code for the above problem in a git repository and share the repo link with us.
2. Document the features and functionalities. Undocumented features will not be considered.
3. Documentation has to be in `.md` files in the repository itself.
